LAB 5 REPORT

MINIMAX ALGORITHM AND ALPHA-BETA PRUNING

Name: Muhammad Usman

Roll No: 070

Section: 3B

For Lab 5 I first drew the small game tree on paper and worked out the Minimax values from the leaves up to the root, and then I wrote the minimax function with recursion for MAX and MIN turns, and after that I added alpha-beta with alpha and beta values and a break when alpha was greater than or equal to beta. The problem I faced was that my leaf counter did not work at first because I used a simple number, so I changed it to a list and then it counted correctly. Another problem was that in the first tree alpha-beta did not prune anything, so I thought my code was wrong, but when I traced it by hand I saw the ordering was the reason, and when I reordered the branches the leaves went from 6 to 8 while the root value stayed 5, which showed me that pruning depends on ordering and does not change the answer.
